

ACTIVE SUBSTANCE EVAPORATORABSTRACT

5 Particularly designed for a dual use, specifically
for using active substances established in a paper tablet
or the like, or in a tray with a semipermeable membrane,
in gel form, consisting of a base body (1) with a U-shaped
10 profile inside which is coupled by insertion a support (8)
provided with two housings (10) and (11), the former
adapted in size and shape to receive within it a tray (13)
and the second to receive a tablet (12), so that both the
tray and the tablet can be placed in the same support
opposite the heating surface (3) of the device, which
15 therefore allows using said device equally with either
format of the active substance.

 The device also includes safety means consisting
of teeth that lock in the closed position, preventing or
making it difficult for children to displace or extract
20 the support from the casing (1), as in order to release it
is necessary to press inwards on two lateral opposing
areas of the casing (1).
